摘要: 文本在引力搜索算法 (GSA) 的基础上, 通过引入粒子群算法中的惯性权重和全局记忆性、时变引力搜索策略和边界变异策略, 提出一种改进引力搜索算法 (IGSA) 来优化 SVM 参数 (IGSA-SVM) 的改进型分类器. 首先选取三个 UCI 数据集进行仿真分析, 结果表明 IGSA-SVM 分类器在分类准确率和分类时间上优于 GS-SVM、GA-SVM、PSO-SVM 和 GSA-SVM 分类器. 然后分别采用线性和非线性模拟电路来进行故障诊断, 结果表明 IGSA-SVM 分类器能有效地防止局部收敛并提高了诊断的优化效率.

Abstract: This paper proposes a modified classifier that uses the improved gravity search algorithm (IGSA) to optimize the parameter of SVM (IGSA-SVM) by introducing the inertia weight and global memory in particle swarm algorithm, time-varying gravitational search strategy and boundary mutation strategy. At first, three UCI datasets are selected for simulation analysis, and the results show that IGSA-SVM classifier is better than GS-SVM, GA-SVM, PSO-SVM and GSA-SVM classifiers in classification accuracy and classification time. Then the linear and nonlinear analog circuits are used as fault diagnosis circuits respectively, and the results show that the IGSA-SVM classifier can effectively prevent local convergence and improve the efficiency of diagnosis.

Key words: support vector machine; improved gravitational search algorithm; analog circuit; fault diagnosis
